[Education]

Ph.D. in Astronomy at **the University of Rome**, joint by Sapienza and Tor Vergata 11/2019-now
(Expected 01/2023)

Thesis: *The Formation and the Chemodynamical Evolution of the Milky Way and the Galactic Components*

Advisor: Prof. Giuseppe Bono

M.S. in Astronomy at **Seoul National University** 2014-2016

Thesis: *Origin of Non-Axisymmetric Features of dE galaxies in the Virgo Cluster*

Advisor: Prof. Woong-Tae Kim

B.S. in Astronomy at **the University of Washington**, Seattle 2009-2013

The Storm King High School, New York 2007-2009

[Ongoing Projects]

- **Stellar Halo**: Study the density distribution and the chemodynamical properties of old stellar Halo by comparing the observed RR Lyrae variables and the Auriga simulations and suggest a possible formation scenario of the Milky Way.

- **Matal-rich RR Lyrae** : Study the chemodynamical properties of infalling progenitors at an early epoch and at $z=0$ to understand the origin of the observed RRLs with disk dynamics.

- **Bulge/Disk**: Study bars, bulges, and disks in the Auriga simulations to understand three different gradients in the radial metallicity profiles of late-type galaxies found in observations.

- **Dark Matter Halo**: Find connection among bulge, stellar halo, and dark matter halo to conjecture the properties of the dark matter halo of the Milky Way.
